COVER STORY

Google Android

Android is a mobile phone platform based on the Linux operating system and developed by the Open Handset Alliance. The unveiling of the Android platform on 5 November 2007 was announced with the founding of the Open Handset Alliance, a consortium of 34 hardware, software and telecoms companies devoted to advancing open standards for mobile devices. When released in 2008, most of the Android platform will be made available under the Apache v2 open-source license.

Open

Android allows you to access core mobile device functionality through standard API calls.

Breaking down boundaries

Combine information from the web with data on the phone -- such as contacts or geographic location -- to create new user experiences.

Fast & easy development

The SDK contains what you need to build and run Android applications, including a true device emulator and advanced debugging tools.
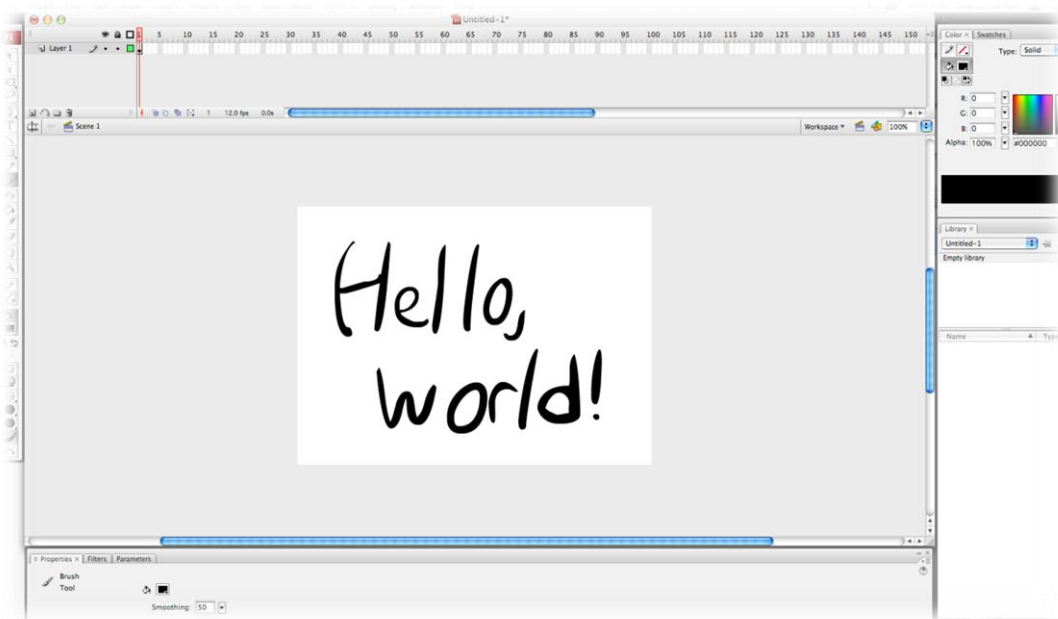

All applications are equal

Android does not differentiate between the phone's basic and third-party applications -- even the dialer or home screen can be replaced

FEATURED

Adobe Flash

Adobe Flash, also known as Shockwave Flash or simply Flash, refers to both the Adobe Flash Player, and to the Adobe Flash Professional multimedia authoring program. Adobe Flash Professional is used to create content for the Adobe Engagement Platform (such as web applications, games and movies, and content for mobile phones and other embedded devices). The Flash Player, developed and distributed by Adobe Systems (which acquired Macromedia in a merger that was finalized in December 2005), is a client application available in most common web browsers. It features support for vector and raster graphics, a scripting language called ActionScript and bi-directional streaming of audio and video. There are also versions of the Flash Player for mobile phones and other non-PC devices.

Since its introduction in 1996, Flash technology has become a popular method for adding animation and interactivity to web pages; several software products, systems, and devices are able to create or display Flash. Flash is commonly used to create animation, advertisements, various web page components, to integrate video into web pages, and more recently, to develop rich Internet applications.

The Flash files, traditionally called "Flash movies" or "Flash games", have a .swf file extension and may be an object of a web page, strictly "played" in a standalone Flash Player, or incorporated into a Projector, a self-executing Flash movie with the .exe extension in Windows. Flash Video files have a .flv file extension and are utilized from within .swf files.
